

Feature	Description
policy_id	Unique identifier for the insurance policy.
subscription_length	The duration for which the insurance policy is active.
customer_age	Age of the insurance policyholder, which can influence the likelihood of claims.
vehicle_age	Age of the vehicle insured, which may affect the probability of claims due to factors like wear and tear.
model	The model of the vehicle, which could impact the claim frequency due to model-specific characteristics.
fuel_type	Type of fuel the vehicle uses (e.g., Petrol, Diesel, CNG), which might influence the risk profile and claim likelihood.
max_torque, max_power	Engine performance characteristics that could relate to the vehicle's mechanical condition and claim risks.
engine_type	The type of engine, which might have implications for maintenance and claim rates.
displacement, cylinder	Specifications related to the engine size and construction, affecting the vehicle's performance and potentially its claim history.

Feature	Description
region_code	The code representing the geographical region of the policyholder, as claim patterns can vary regionally.
region_density	Population density of the policyholder's region, which could correlate with accident and claim frequencies.
airbags	The number of airbags in the vehicle, indicating safety level which can influence claim probability.
is_esc (Electronic Stability Control), is_adjustable_steering, is_tpms (Tire Pressure Monitoring System)	Features that enhance vehicle safety and could potentially reduce the likelihood of claims.
is_parking_sensors, is_parking_camera	Parking aids that might affect the probability of making a claim, especially in urban areas.
rear_brakes_type	Type of rear brakes, which could be related to the vehicle's stopping capability and safety.
Various binary indicators (Yes/No) for specific vehicle amenities and safety features	Features like steering_type, turning_radius, length, width, gross_weight, etc., which together build a profile of the vehicle's characteristics and its associated risk factors.
claim_status	Indicates whether a claim was made (1) or not (0), which is the dependent variable the model aims to predict.
